Graph Representation:

Comments:

I've created scatter plots to visualize the performance of different sorting algorithms across various array sizes for four array types (A, B, C, D). My main observations are that Arrays.sort() consistently outperforms other algorithms, while Bubble Sort shows the worst performance, especially as array sizes increase. Quick Sort and Selection Sort fall between these extremes. The differences in time complexity become more evident with larger arrays, with Bubble Sort's performance degrading rapidly. Interestingly, the different array types seem to affect algorithm performance, suggesting varying levels of pre-sortedness or distribution in the data. I used a linear scale for the plots, which effectively shows differences at smaller array sizes. To keep other algorithms visible, I excluded the 1M element data for Arrays.sort() and Quick Sort. Overall, these visualizations clearly compare sorting algorithm efficiencies, highlighting how algorithm choice significantly impacts performance based on data characteristics and size.

Step 3

Now you will produce a report summarizing your findings.

- 1. Provide four tables (For four arrays a,b,c, and d respectively). Each row (or record) should provide the run- time for using any particular sorting algorithms, where the columns are for the size of the input. Please re- fer: http://lti.cs.vt.edu/LTI_ruby/Books/CS172/html/SortingEmpirical.html Table 9.15.1 for the format. Each table should have six (6) rows (representing six sorting algorithms) and seven(7) columns (representing seven data files).
- 2. Generate four plots for four arrays. Use the data from the earlier table to plot the relative performance of each algorithm. Use Logarithmic scale for x-Axis depicting input size. Comment on your finding. Save the screenshots, tables, plots, and your findings as Lab7Report. pdf.
